

Entity Resolution and Affiliate Mapping Procedures

1. Overview

Entity resolution confirms the legal identity of a prospective client and maps its affiliate and related-party structure before an onboarding case can proceed past the Intake stage.

2. Legal Entity Identification

The legal entity name, registered address and jurisdiction of incorporation must be confirmed against an external company registry. A Legal Entity Identifier (LEI) must be captured where the client operates in scope for derivatives trading.

3. Affiliate Mapping

Affiliates, parent companies and subsidiaries with more than 25% common ownership must be identified and linked to the CustomerID of the primary entity. This mapping is used to detect existing relationships the firm may already hold with related entities.

4. Duplicate Detection

Before creating a new CustomerID, the onboarding agent must search existing customer records by legal name, trade name and registered address to avoid creating duplicate customer records for the same legal entity.

5. Escalation

Where the entity structure cannot be resolved with confidence, the case is flagged for manual review by a senior onboarding analyst before screening begins.
