

Quality Control Manual for Incoming Supplies

1. Inspection Criteria

Incoming goods must be inspected against product specifications including dimensions, weight, and visual defects. At least 5% of each shipment is subject to random sampling inspection. Inspection results are recorded in quality logs for traceability.

2. Defect Classification

Defects are categorized as critical, major, or minor. Critical defects include safety hazards or functionality failure and require immediate rejection. Major defects affect performance but not safety and require supplier notification and correction. Minor defects do not affect function.

3. Sampling Procedures

Sampling sizes are determined following ANSI/ASQ Z1.4 standard. For shipments under 500 units, at least 20 units are sampled. For larger shipments, a sampling percentage between 2% and 5% is used depending on supplier history and product complexity.

4. Rejection and Disposition

Rejected shipments are quarantined and segregated immediately. Suppliers must be informed within 24 hours with detailed defect reports. Corrective shipments should be dispatched within 15 business days. Non-compliance may lead to financial penalties.

5. Documentation and Traceability

All inspections are documented on receipts and quality checklists. Traceability records include batch numbers, supplier IDs, and inspection dates. Records are maintained for a minimum of three years for audit purposes.

6. Supplier Quality Ratings

Suppliers are scored quarterly based on defect rates, inspection results, and timely corrective actions. Scores below 85% trigger quality improvement plans and on-site audits. Recognized high-performance suppliers receive preferred status and additional contracts.

7. Training Requirements for Inspectors

Only trained and certified quality inspectors may perform acceptance inspections. Training includes product knowledge, defect identification, and use of inspection tools. Retraining is required every two years or earlier if inspection deficiencies are observed.

8. Continuous Quality Improvement

Quality data is analyzed monthly to identify trends and problem areas. Collaborative problem-solving sessions with suppliers focus on root cause analysis and corrective action implementation. The goal is a reduction of defects by 10% annually.
