

Document Intelligence OCR Validation Rules

1. Purpose

Uploaded KYC documents are processed with Document Intelligence to extract structured fields and validate them against the onboarding policy schema.

2. Extraction Fields

For identification documents, the extraction covers full name, date of birth, document number, issuing authority and expiry date.

3. Validation Rules

Extracted full name and date of birth must match the corresponding Customer record within a defined fuzzy-match tolerance. Documents past their expiry date are automatically rejected.

4. Deduplication

Documents forwarded multiple times within the same case, or across related cases for the same customer, are deduplicated using a content hash before being counted against the checklist.

5. Exception Handling

Any document that fails validation is routed to a human analyst for manual review rather than being silently rejected or silently accepted.
