

Work IQ Estate Mining and Pre-Population Guidelines

1. Purpose

Work IQ mines the firm's own Microsoft 365 estate to pre-populate onboarding case fields and draft documentation from information the firm already holds, so the client is only asked for what is genuinely missing.

2. Sources Considered

Eligible sources include existing client folders, prior correspondence, briefing notes and previously completed KYC records held on affiliated entities.

3. Permission and Sensitivity Boundaries

Estate mining respects existing file permissions and sensitivity labels. Content the requesting user or agent identity does not already have access to is never surfaced, regardless of relevance.

4. Confidence Thresholds

Pre-populated field values are only written to the case automatically when the extraction confidence score is 90% or higher. Lower-confidence matches are presented to the analyst as suggestions requiring manual confirmation.

5. Audit Trail

Every pre-populated field records its source document and extraction confidence so a reviewer can trace how the value was derived.
