

Straight-Through Onboarding Rate Measurement

1. Purpose

This document defines how the straight-through onboarding rate is calculated and used to tune the onboarding process.

2. Definition

The straight-through onboarding rate is the percentage of onboarding cases that reach ReadyToTrade status without any manual escalation or exception.

3. Calculation Window

The rate is calculated monthly across all cases that reached ReadyToTrade status within the reporting month, regardless of when the case was opened.

4. Contributing Factors

Cases with complete pre-population from Work IQ and Clear screening results from Web IQ have a materially higher probability of straight-through completion.

5. Continuous Improvement

Fabric IQ models the client and legal-entity ontology using historical case outcomes to identify which stages most often cause exceptions, feeding process tuning recommendations back to the onboarding team.
